

Movie Review

You should create a new repository, and build a rails project step by step. Also, you need to make your git commit readable.

1. Users can Sign in and Sign up. Use username.
2. When users sign in they should provide their address. their address will come from the region, province, city/municipality and barangay models. Use the PSGC API.
3. Users can create a movie. Movies should have a title, blurb, date released, country of origin, showing_start and showing_end.
4. Movies can have many genres. Genres should be put in seeds.
5. Use pagination for movies. Make sure that after you update a movie, you'll be redirected back to the same page in the pagination where the updated movie can be seen.
6. Users can post reviews. Reviews should have content and rating, which is equivalent to a number between 1-5.
7. Reviews should be ordered by ratings in descending order.
8. Display the average rating of a movie in the index and show page.
9. Users can update their own reviews. However they can only update the content, rating can't be updated.
10. Every movie has a shortened url, and the unique string should be built using 7 alphanumeric characters. ex: Ac312dV, s9sP69q.
11. On the index page, movies can be filtered by genres, and showing status.
12. Order the movies by rating. The top 3 movies should be labeled as 'Hot'. Take note that once the movies are filtered the overall top 3 should still get the label and not the filtered top 3.
13. Use soft kill for both movies and reviews.
14. Use Bootstrap to beautify the view.
